VPL™ Skin Rejuvenation

Thread Veins • Sun & age spots • Acne • Rosacea
Fine lines & wrinkles • Enlarged pores • Pigmentation

It's all about feeling good

VPL™

Safe and effective skin treatments

Sun damage and the effects of time can leave your skin looking tired and prematurely aged, resulting in skin imperfections on your face and body.

VPL™ offers a safe, fast, non-surgical treatment solution for a wide variety of such skin conditions for both men and women. It is also very effective in reducing and controlling active acne and Rosacea, along with the associated inflamed skin.

How does it work?

VPL™ utilises the latest advance in pioneering Variable Pulsed Light technology.

This effective and safe treatment uses, short, controlled pulses of filtered light energy to target the appropriate structures within the skin to reduce imperfections and improve skin texture and tone.

The treatment

After a full consultation a comprehensive treatment programme will be devised to give the best outcome for your needs.

The area to be treated will be thoroughly cleansed and a cooling gel applied to ensure that the light absorption is optimised for maximum results. The VPL™ applicator will be placed onto your skin and flashed in a series of shots to treat the area.

Treatments are reviewed continuously to assess their effectiveness and settings are adjusted to ensure the best results are achieved.

Seeing results

Significant improvements will be seen in your skin condition after a regular course of treatments.

We will advise you on a personal skincare routine that will care for and enhance your renewed skin tone and texture.

Treatments available

Sun and age spots

These are conditions which usually appear in later years on the skin surface. They are all caused by an excess production of melanin, the pigment which determines our hair and skin colour.

During treatment the melanin absorbs the light energy from VPL™ and heats up quickly, whilst the surrounding skin remains cool. The heat causes the particles of melanin to break up and subsequently be removed by the body's natural waste processes, leaving skin clear and smooth.

Thread veins, spider naevi, cherry spots and rosacea

These are conditions where small veins become visible on the skin's surface. During treatment light energy from VPL™ is absorbed by the blood vessels that make up these imperfections.

This absorption process breaks down the vessels, which are then recognised by the body as waste and removed naturally. In the same way VPL™ can also help control the symptoms of rosacea, reducing redness and inflammation.

Fine lines and wrinkles

Collagen is the substance produced by our bodies that keeps our skin looking youthful and smooth. As we age, and after prolonged sun exposure, our bodies naturally produce less and less collagen, resulting in the appearance of fine lines and wrinkles.

The light from Energist VPL™ stimulates cells in the body called fibroblasts to produce more collagen. The new collagen moves outwards to the skin's surface resulting in a smoother texture, smaller pore size and reduced fine lines and wrinkles.

Acne

Acne is caused by excess sebum (an oil produced by the body) which, together with dead skin cells, clogs up pores and becomes a breeding ground for bacteria, thus causing irritation

Energist VPL™ improves both active acne and prevents acne scarring by destroying the bacteria that causes the irritation. Acne is reduced significantly following a course of treatments and skin texture and tone is improved through associated collagen production.
